

May 25 - May 31, 2001

During the past week all Terra instruments, with the exception of MOPITT, operated normally.

A series of eight tests to characterize the behavior of the displacer unit in the MOPITT cooler were conducted on June 1.

The Terra Solid State Recorder (SSR) anomaly team is continuing in its efforts to identify the specific cause of the memory board anomaly on May 21. Operations are continuing normally with the one memory board removed from operations.

MISR operations are proceeding as planned after the successful flight software update last week.
